Final Project Development 2

1.   A modern design and indications of when the site was last updated with menu update indications would allow users to know that the information they are seeing is current. Additionally, it is possible to have in the page regarding doctors without borders some of the current articles they have listed on their website. For the purpose of the final project, the information of an article will be spoofed(not live/current) but it would be possible using a data scraper at server level to collect the value attribute data on class= article div elements on the doctors without borders page upon request for the Papa Juan page being sent to a client, then populate the client page articles with data from the scrape. That would allow the most up to date information to be presented to the potential client and provide a feeling of currency advantage. The site could also include an events page to indicate when mariachi and local bands are playing with updates to those events status.

2.   I could add share buttons that drop down to link to the restaurant (fake) facebook page and an onclick copy for the website's address (which may or may not work due to the setup of the student server). These could be located at the footer of every page

3.   A contact us page will be the sites main interactivity advantage as it will have phone number listing and mailto form so clients to contact us.

4.   "Mi pizza es su pizza" which translates to "My pizza is your pizza" which is familiar to "my house is your house". This all relates to the idea that the restaurant is very much active in the spirit of giving and it's culture in Hispanic "home" style cooking which will give a familiar home feeling to all patrons who come to indulge in our great food. The name itself is most important for the focal point and thus it will have the largest font size, tag smaller and only on header area while potentially just being on one page pending design changes if desired. It would hide on smaller view windows.

5.   Colors are pending still however, I can say the colors would likely be vibrant colors representative of Mayan culture (leaning toward cyan/teal, white/beige, and red/red-orange). The colors would visually tell the user that the restaurant is of Hispanic origin.

6.   Papa Juan's Mexican Pizzeria specializes in making the most harmonious pizzas that provide an incredible adventure for your taste buds.   We not only care about the food and service we provide, but we also care about those who may need more.

We use the best spices obtained from local markets within our community to provide business and growth to the very people we serve. With our expert chef's trained by the owner himself on the excellent cooking from where he grew up, we can make any order placed using the ingredients you select from our menu. Small donations can be added to every order you desire and they will go directly to the doctors without borders cause.

Papa Juans was established early into the pandemic when Papa J. saw the need for better, cheaper food for a struggling economy, broken by the pandemic. Papa J. who at the time had been working within the hospital industry fighting the coronavirus pandemic final decided to set up shop on August 24, 2020. When his co-worker, a fellow medical professional heard of his efforts, word was put into the hospital organization and Papa J. received funding to aid in the effort. Their help was not forgotten, and to pay it even further to those in need, Papa J. began his initiative to further help those in need by declaring the organization permanent position in supporting the doctors without borders cause. You can visit the non-profit organization by pressing the links below.

7.   Responsive website design will allow easier view across all devices. This will make the site look more professional, easier to use, and appealing which can further the likelihood of users becoming clients. As the page gets smaller, borders will disappear, nav bar will compress and images not apart of the food gallery will hide.

8.   Proper use of element tags will allow screen readers to properly voice to those who use it the formal location of what the page would look like. This is a requirement as the use of nothing but divs could create a mess for such tools. Good contrast is another must as much of the content should not require the user to squint to see the information they desire.
